3.9 Unhandled Exception when Drill-Down Sheet Position is Changed	8
4. Known Issues	9

1. New Features

No new features

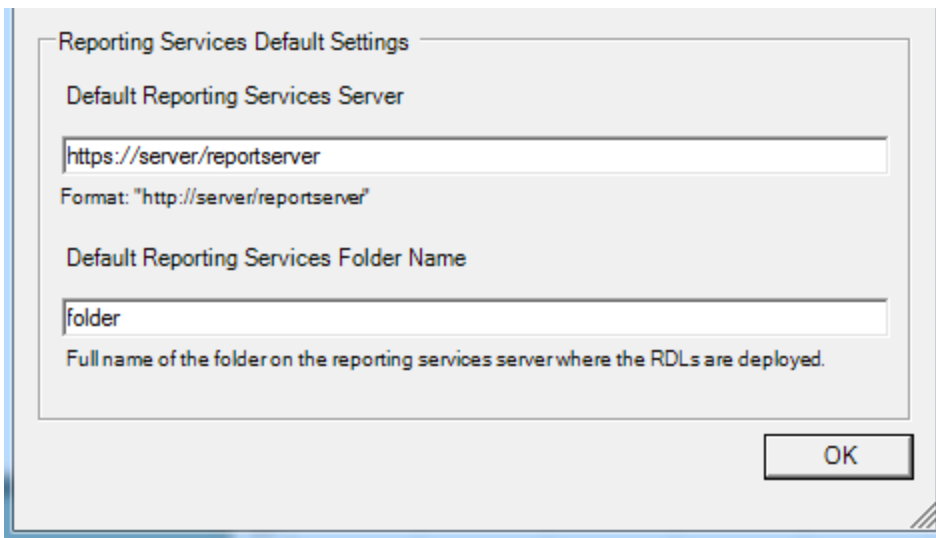

2. Product Enhancements

2.1 Application Settings Dialog Support

Users are provided an error prompt if the Reporting Services path contains syntax issues.

The Default Reporting Service Server field also now accepts HTTPS protocols.

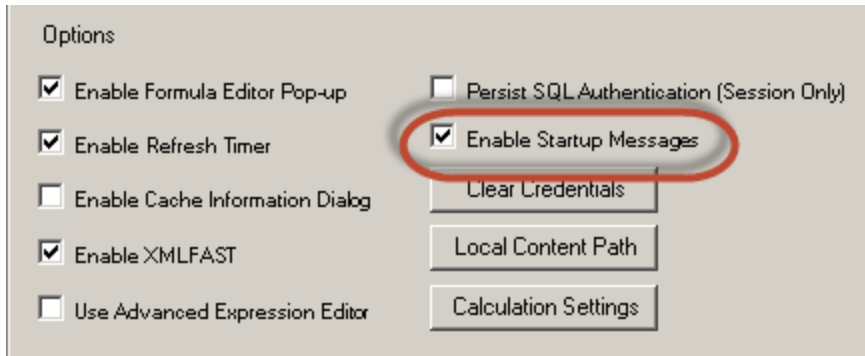

2.2 BizInsight Load at Startup Prompt Messaging

When BizInsight is activated, the application verifies the configuration path and presence of biz files in a valid folder path. If the configuration path or biz files are missing, BizInsight will prompt the user to select the new option to suppress all further warning messages. Check the “Don’t ask me again” box to suppress further warning messages. In the Application Settings, the warning messages can be reactivated by enabling the warning message.

When “Don’t ask me again” check box is checked, the below two warning messages are suppressed in future loads.

Users can re-enable the warning messages in the Application Settings and check the “Enable Startup Messages” check box.

2.3 Switching Metadata Connection Prompts Message Box to Close All Workbooks

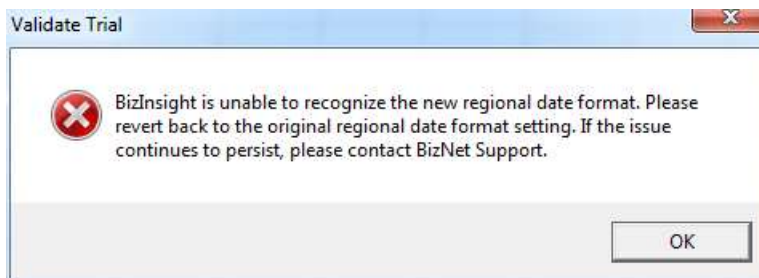

Users switching from Configuration Path folder to SQL Metadata connection in the Application Settings are required to restart Excel to reload BizInsight Navigation Pane. A new message prompts users to close Excel.

3. Issues Resolved

3.1 New Trial Mode message prompt when users switch Windows OS region date format

Trial Mode fails if the user changes the region date settings on their local machine after BizInsight has been installed. A new message informs the user of the region date format change and requires the local machine to revert back to the original regional date format. This issue or message does not occur with a licensed BizInsight.

3.2 Excel 2013 Drill-down breaks with functions containing more than 255 characters

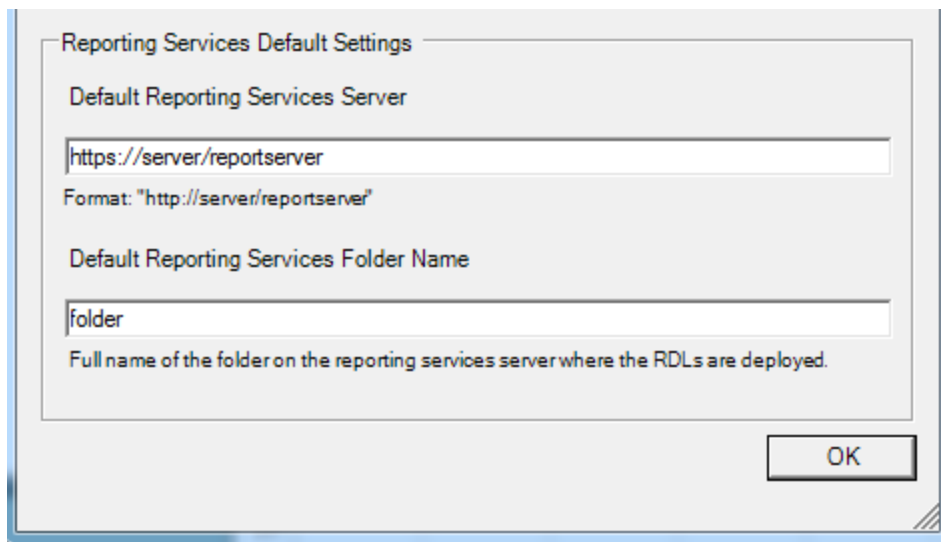

In previous Excel compatible BizInsight releases, users on Excel 2013 were unable to drill-down on a function when the function contains more than 255 characters combined and would receive the following error message:

This issue has been addressed and users are now able to drill-down on functions without a 255 character restriction.

3.3 Application Setting Allows HTTPS protocol

In the Application Settings, the Default Reporting Services Server accepts HTTPS protocols.

3.4 BizInsight Viewer (Power) User Issue When Deleting Multiple Columns

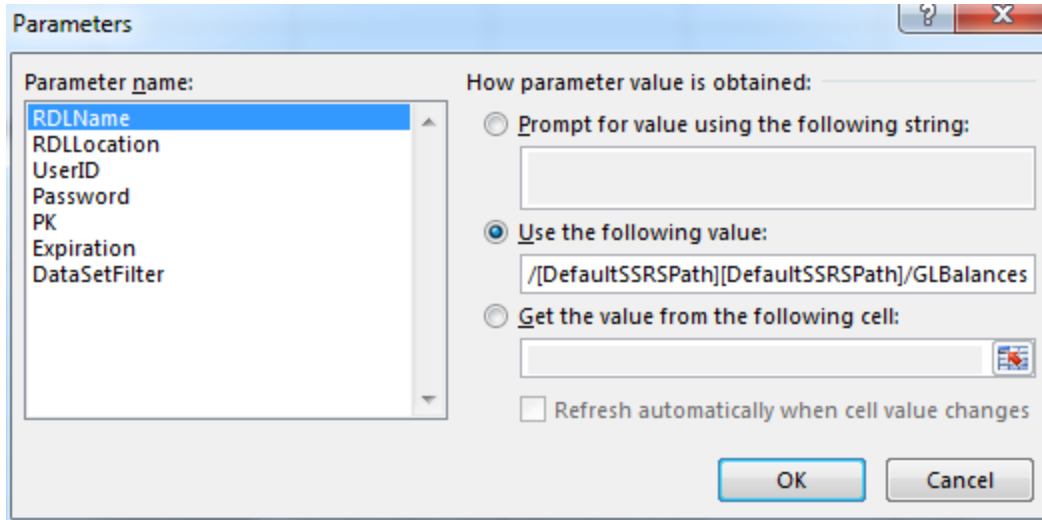

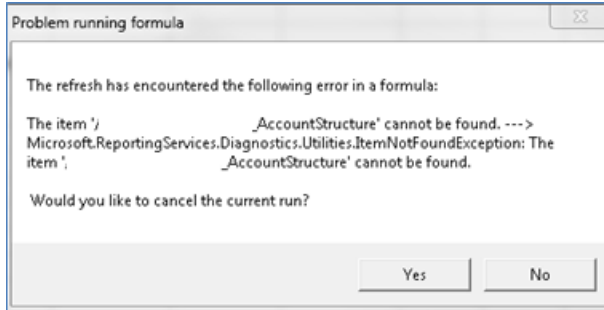

Viewer (Power) users were receiving an out of memory exception message when deleting multiple columns from a worksheet. This issue has been resolved in this release.

3.5 BizInsight Developer users loss of features with multiple workbooks at Load at Start Up

Primarily in Office 2013, BizInsight Developer Users experienced a loss of features in other workbooks when multiple Excel instances were opened. This issue has been resolved in this release to support multiple Excel instances.

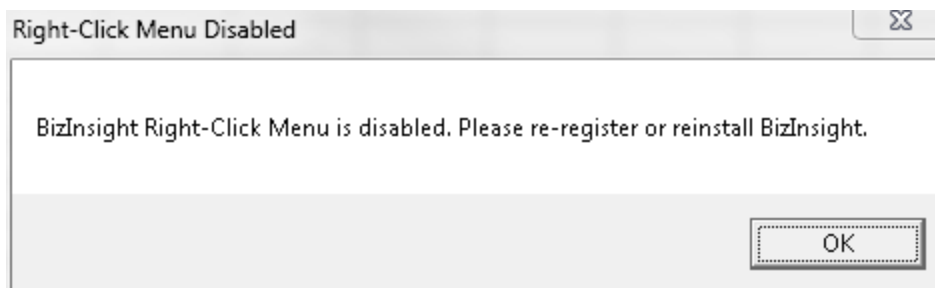

3.6 Problems with Reporting Services Folder Name Change with Previously Created Workbooks (Analysis Sets Only)

In a situation when the user has fully installed BizInsight and deployed all content pack files into the Reporting Services folder, an issue occurs with existing workbooks containing Analysis Sets. The workbooks retain information about the location of the Reporting Services folder. When the Reporting Services folder is renamed to the same name as the content RDLName, Analysis Sets in previously built workbooks fail to refresh. The issue occurs in the Analysis Sets parameter which the value [DefaultSSRSPath] is duplicated twice due to the renaming of the folder.

3.7 New error message when BizInsight right-click menu becomes disabled

When the right-click menu does not display, BizInsight users will be prompted to re-register or reinstall BizInsight to resolve the issue.

3.8 Trial Mode Displays Incorrect Expiration Date in Region Date Settings

When using BizInsight in Trial Mode, the About dialog would display an incorrect expiration date if the user changes the regional date settings on their local machine after BizInsight was installed. This issue has been addressed.

3.9 Unhandled Exception when Drill-Down Sheet Position is Changed

When a user drills-down on a function and then changes the position of the drill-down sheet to another position, the user received an error when attempting to drill-down on another function or performed a BizNet Refresh. For example, if Drilldown(2) is moved from before the sheet named Income Statement to after, the exception would occur.

This issue with repositioning of worksheets has been resolved.

4. Known Issues

1. Most errors when using F2 return #VALUE!

When using F2 to refresh a function, any errors that may occur will not be presented to the user and the cell will update with #VALUE. Go to **About > Support Tools > View Events** to see the cause of the #VALUE.

2. Scan for Content throws an exception on Office 64-bit versions when moving from one set of Content Packs to another

For example, if a user is currently using SunGard GL and wishes to switch to another configuration folder containing a different set of Content Packs, ex: SunGard AP and SunGard AR, ScanForContent throws an exception when it is not able to find the SunGard GL 64-bit files in the content path. This should occur rarely in customer environments, but developers might encounter this error. The workaround is to manually register the new 64-bit content.

3. Best practice for BizInsight setup and ScanForContent feature:

Install BizInsight > Open Excel > Click BizInsight Explorer ribbon button > Close Excel > Open Excel > Click Application Settings button and configure if needed > Click Scan for Content button > Close all Excel sessions > Open Excel.

BizInsight Workbooks requires users to enable Excel Protected View

4.

Protected View is a read-only mode where most editing functions are disabled. There are several reasons why a file opens in Protected View.

If you only need to read the workbook, and not edit it, you can remain in Protected View, but without BizInsight features enabled. If you know the workbook is from a trustworthy source, you can save the workbook locally on your computer. After you save it on your computer locally, it becomes a trusted document and BizInsight features will be enabled.

5. Microsoft Office Excel 2013 Disable Start Screen Issue

In Excel 2013, a new feature allows users to disable the Excel Start screen.

This option causes a different behavior with BizInsight workbooks. If Excel is launched first, regardless of whether BizInsight is loaded on-demand or at start-up, the workbook functions return a #VALUE! BizNet recommends that users who disable their Excel Start Screen open the workbook file first rather than launching the Excel application.

BizInsight Load On-Demand: Open a BizInsight workbook > launch BizInsight > open other BizInsight workbooks

BizInsight Load at Start-Up: Open a BizInsight workbook > open other BizInsight workbooks
